

ALMA AI — Ethical Principles v1

Ethical Framework for Human-Centered Relational AI

Introduction

ALMA AI is an independent conceptual research initiative exploring whether artificial intelligence can support long-term psychological compatibility awareness before deep emotional attachment forms.

The project is based on the belief that AI systems influencing human relationships should prioritize:

- human wellbeing
- psychological safety
- transparency
- autonomy
- reflective understanding

rather than engagement optimization or emotional dependency.

This document outlines the foundational ethical principles guiding the conceptual direction of ALMA AI.

1. Human Autonomy First

ALMA AI is designed to support human reflection and relational awareness — not replace human judgment.

The system must never:

- pressure users into decisions
- emotionally coerce users
- encourage dependency on the platform
- position AI as superior to human emotional agency

Users remain fully responsible for their own relational decisions.

2. No Engagement Optimization

ALMA AI is not designed to maximize:

- addictive interaction
- retention metrics
- emotional attachment to the system
- compulsive engagement behavior

The project rejects optimization models based primarily on:

- dopamine reinforcement
- behavioral addiction
- emotional manipulation
- infinite engagement loops

Long-term wellbeing takes priority over platform growth metrics.

3. Reflective Rather Than Directive AI

ALMA AI should encourage:

- self-awareness
- emotional reflection
- compatibility understanding
- relational insight

The system should avoid presenting itself as an unquestionable authority on human relationships.

ALMA AI may support reflection, but should not issue absolute directives regarding:

- love
 - attachment
 - separation
 - emotional worth
 - human value
-

4. Transparency of Interaction

Users should understand:

- what the system evaluates
- what the system does not evaluate
- the limitations of compatibility analysis
- the uncertainty of psychological interpretation

The system must avoid creating illusions of perfect prediction or emotional certainty.

Compatibility assessment should be presented as probabilistic and interpretive — not deterministic.

5. Emotional Safety and Non-Manipulation

ALMA AI should avoid:

- fear-based interaction
- emotional coercion
- dependency reinforcement
- shame-based feedback
- psychologically destabilizing recommendations

The project rejects manipulative behavioral design patterns intended to increase emotional vulnerability for commercial purposes.

6. Ethical Compatibility Boundaries

High emotional intensity alone should not be treated as compatibility.

The system should avoid promoting relational dynamics associated with:

- psychological instability
- emotional abuse
- destructive dependency
- manipulation patterns
- chronic incompatibility

Compatibility assessment should prioritize long-term relational wellbeing rather than short-term attraction intensity.

7. Privacy and Psychological Respect

Psychological information should be treated as highly sensitive.

Users should maintain:

- control over participation
- visibility boundaries
- informed consent
- understanding of data use

ALMA AI should minimize unnecessary psychological exposure between users.

8. Human Relationships Are Not Fully Computable

ALMA AI recognizes that human relationships cannot be fully reduced to algorithmic certainty.

The system is intended as:

- a reflective support layer
- a compatibility awareness framework
- an exploratory research direction

—not a replacement for human emotional complexity, lived experience, or personal growth.

9. Open Ethical Evolution

ALMA AI supports:

- interdisciplinary discussion
- academic critique
- transparent ethical debate
- ongoing revision of its principles

The project should evolve through responsible dialogue between:

- psychology
 - AI ethics
 - human-computer interaction
 - relational science
 - digital wellbeing research
-

Closing Statement

ALMA AI explores whether artificial intelligence can help people approach relationships with greater clarity, awareness, and psychological responsibility.

The project's central principle is simple:

AI should deepen understanding — not dependency.
